Application for Position Title

Dear NAME HERE

Dear Hiring manager,

I am applying for the position Software Developer at D2L. I believe I have found THE job for me. My passion with teaching, education and learning, meets my deep technical knowledge. In high school my passion project was a learning assistant, an system that helped me learn, implementing all the learning techniques like spaced repetition, and interleaving etc. And right now, in Univresity, I have a whole youtube channel, with videos that got 20K+ views that explains how I learn, how I take notes in the field of CS. I am even thinking about starting my own business selling, my learning system, and how I take notes. Because I think it has truly revolusationized how I learn in univeristy, in terms of how much I can learn, how much I can retain, and how good it just feels to be able know that the stuff I am learning now won't be forgetton.

I have experience in majority of the backend tech stack already, and the ones, I don't have, being an avid learning, and someone who pride themself on the fact they can learn fast, and being a problem solver, I am able to solve any problem you give me. The experience you are looking for, like mobile development, cloud infrastructure, and backend serverless development has my work from passion projects and past internships.

From my past internship, I had to teach my team about MCP and it's limitation when it had just started rolling out and gaining popularity. There was a lot of nuance, and alot of noise in the AI agentic programming community around that time, and I was able to give my team the full picture, because I was able to distill information really well. On top of that, I am able to work on my own, with tight deadlines, and communicate with my team the result I got.

something that's not on my resume, is that I am people's person. I bring excellent energy, and a strong work ethic.

Sincerely,

Sean Yan
